

EXPERTS IN FLAMES®

Our customers are the leading companies and authorities within defense and security. They are experts in their products and Sjöland&Thyselius is their expert in FLAMES. Sjöland&Thyselius can offer integration and development of simulation models and services using FLAMES.

FLAMES has the ability to integrate models of almost any type of entity and to support interfaces to almost any live or virtual system. That's why so many organizations around the world have developed their testing, training, and mission rehearsal systems using FLAMES.

FLAMES IS

- a powerful simulation framework that addresses all aspects of constructive simulation development and use
- execution of scenarios
- visualization of scenarios
- scenario analysis
- interfaces to constructive, virtual and live systems

INTEGRATION OF SIMULATIONS MODELS

Switching to commercial software has many advantages such as reduced maintenance costs and improved productivity. You can focus on your simulations, and not the software.

Our customers have usually a rich heritage of simulation models from existing simulators. Migration of these legacy models can present an initial inertia to overcome before meaningful simulations in FLAMES can be executed and evaluated.

We have the experience and can provide the service to speed up the migration to FLAMES simulation framework.

SJÖLAND&THYSELIUS RELIEVES THE WORKLOAD

Since the FLAMES licensing model is focused on the developer, you could potentially find yourself in a situation where there's a peak in the work load but not enough licenses or employees to complete the project on time. Instead of spending money on additional licenses, or postpone a due date, we

DEVELOPMENT OF SIMULATION MODELS

We can provide development of simulation models given a specification of the real world system tailored to your needs.

INTEGRATION WITH EXISTING ENVIRONMENT AND SYSTEMS

The FLAMES simulation framework can be extended with additional services to meet customer needs. We can provide integration with existing networked simulators and create custom client applications to allow human interaction of real time executed scenarios.
